PORTFOLIO CASE STUDY · POWER BI

Streaming catalogue: where the audience goes, and where the value is

7% of 2,500 films hold 65% of all audience votes, and popularity says nothing about quality. I found 415 well-rated, little-seen films worth licensing.

DATA
2,500 films (1970-2023), 167M votes, 2,000 people

MODEL
Film-centred model with genre and talent bridges

REPORT
17 pages: 13 story, 3 bento dashboards, 1 drill-through

Power BI · DAX · Many-to-many modelling · Content analytics · Data validation · Storytelling

THE PROJECT

The challenge

An acquisitions team wanted to know where audience attention goes, whether popularity or genre predicts a good rating, and which films and directors are worth licensing.

The data

An IMDb-style catalogue: one rating per film, with bridge tables linking films to about two genres each and to directors and cast. Titles and people are anonymised, and runtimes take only a few values, so it is a teaching sample rather than a live catalogue.

My approach

1. Checked every measure with DAX queries against the stored data.
2. Fixed a genre concentration index that squared shares adding up to 200%.
3. Relabelled 48 films with no runtime that were reported as "Under 60".
4. Added hidden-gem, vote-concentration and director track-record measures.
5. Built 13 story pages and 3 bento dashboards with a director drill-through.

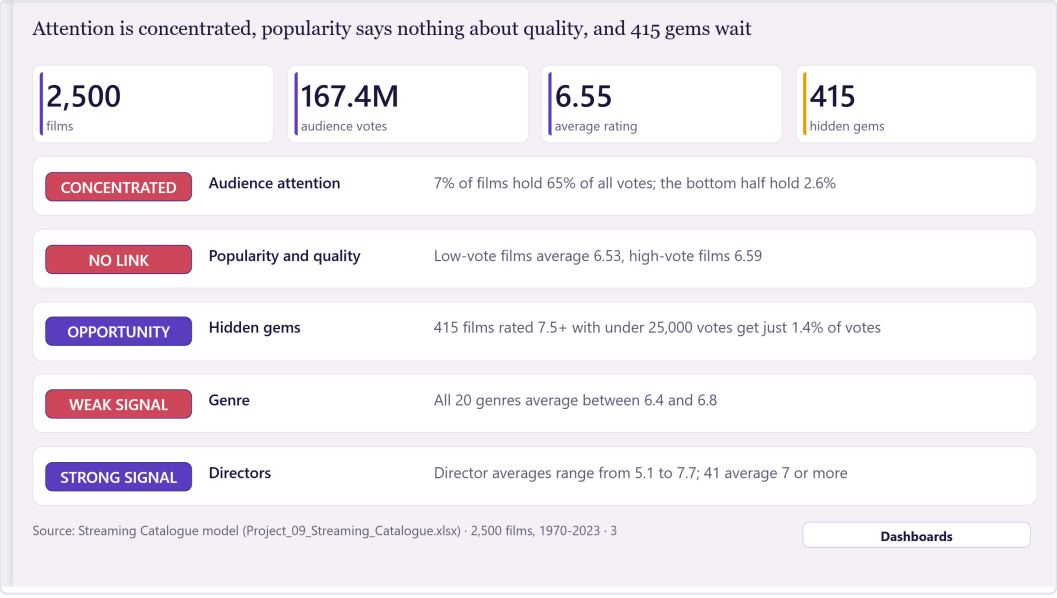

Headline numbers

2,500
films, 1970-2023

65%
of votes held by 7% of films

6.55
average rating at every vote level

415
hidden gems to license

The scorecard page: headline KPIs and verdicts on each finding.

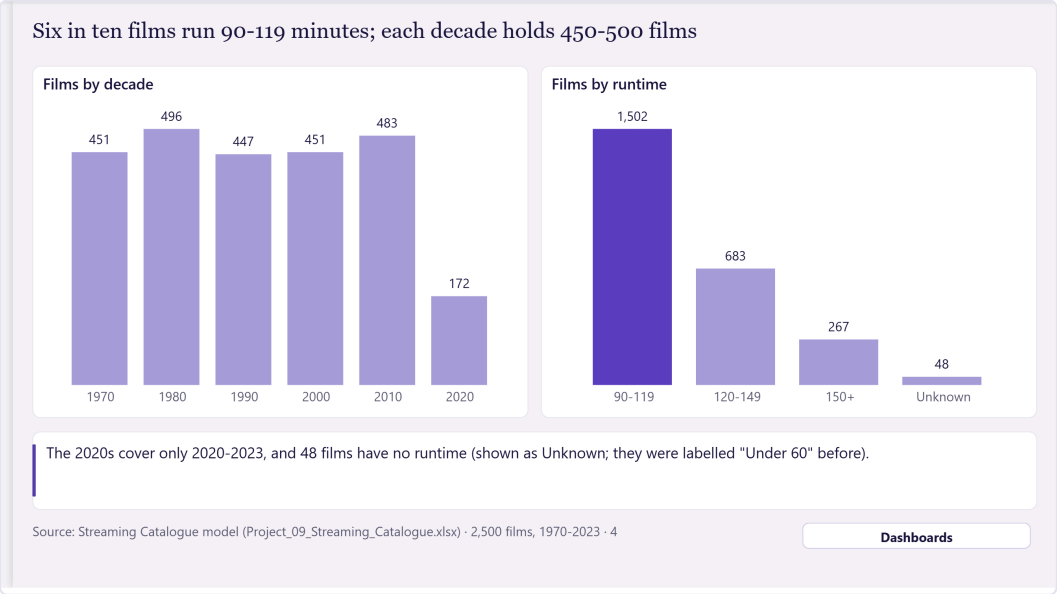

RESULTS

Key insights

Attention is concentrated	175 high-vote films hold 65% of votes; the bottom half hold 2.6%.
Popularity does not predict quality	Low-vote films average 6.53, high-vote films 6.59.
415 hidden gems	Rated 7.5+ with under 25,000 votes; they average 8.17 but get 1.4% of votes.
Genre is a weak signal	All 20 genres average between 6.4 and 6.8.
Directors are a strong signal	Director averages range from 5.1 to 7.7; 41 average 7 or more.

Recommendations

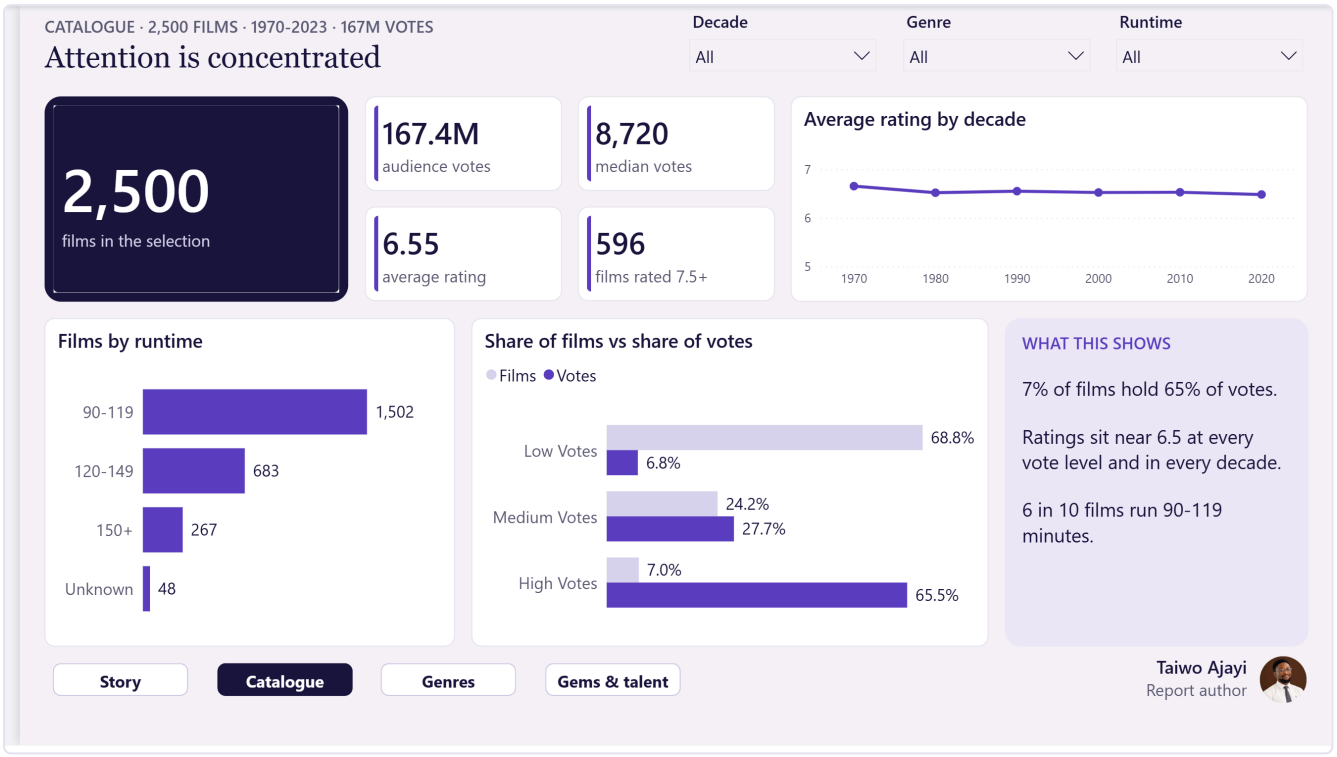

1. License the hidden gems, starting with Crime, Thriller, Drama and Biography.
2. Shortlist by director track record.
3. Do not pay a premium for vote counts alone.

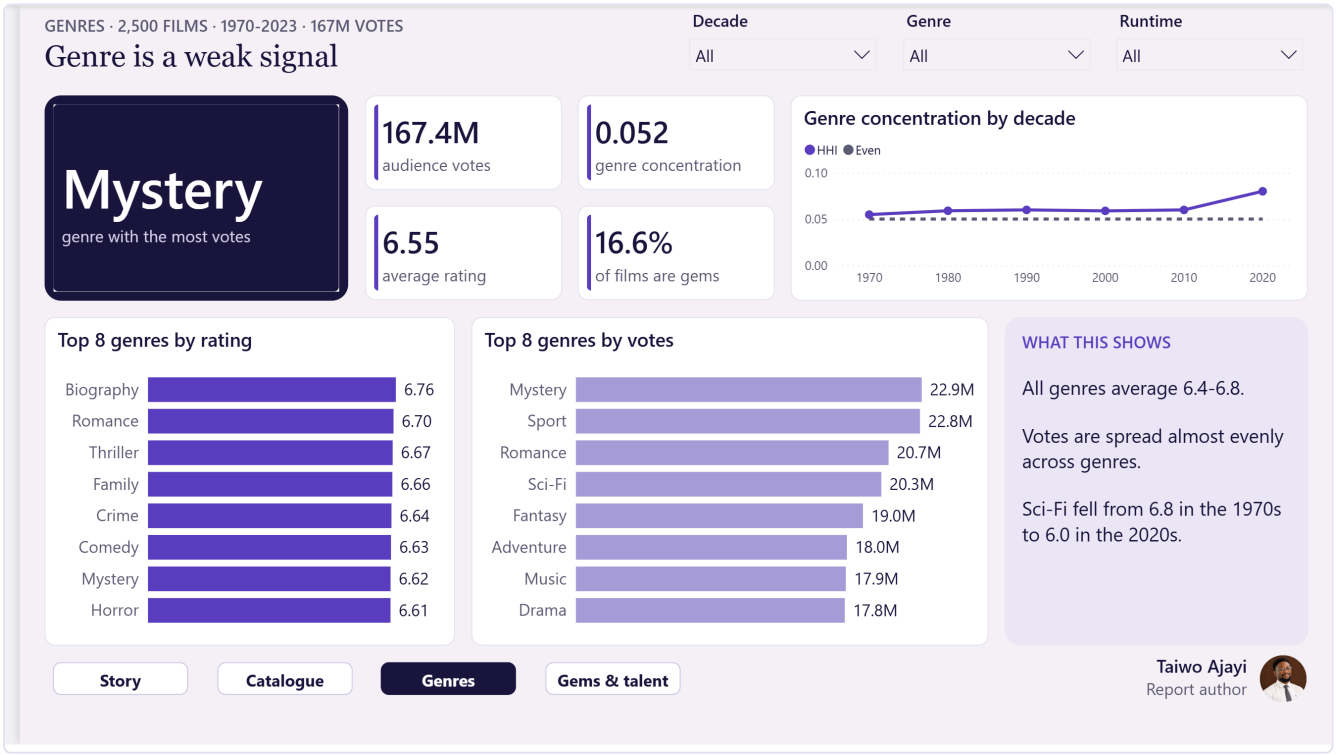

A story page: the title states the finding and the chart shows the evidence.

Three interactive dashboards

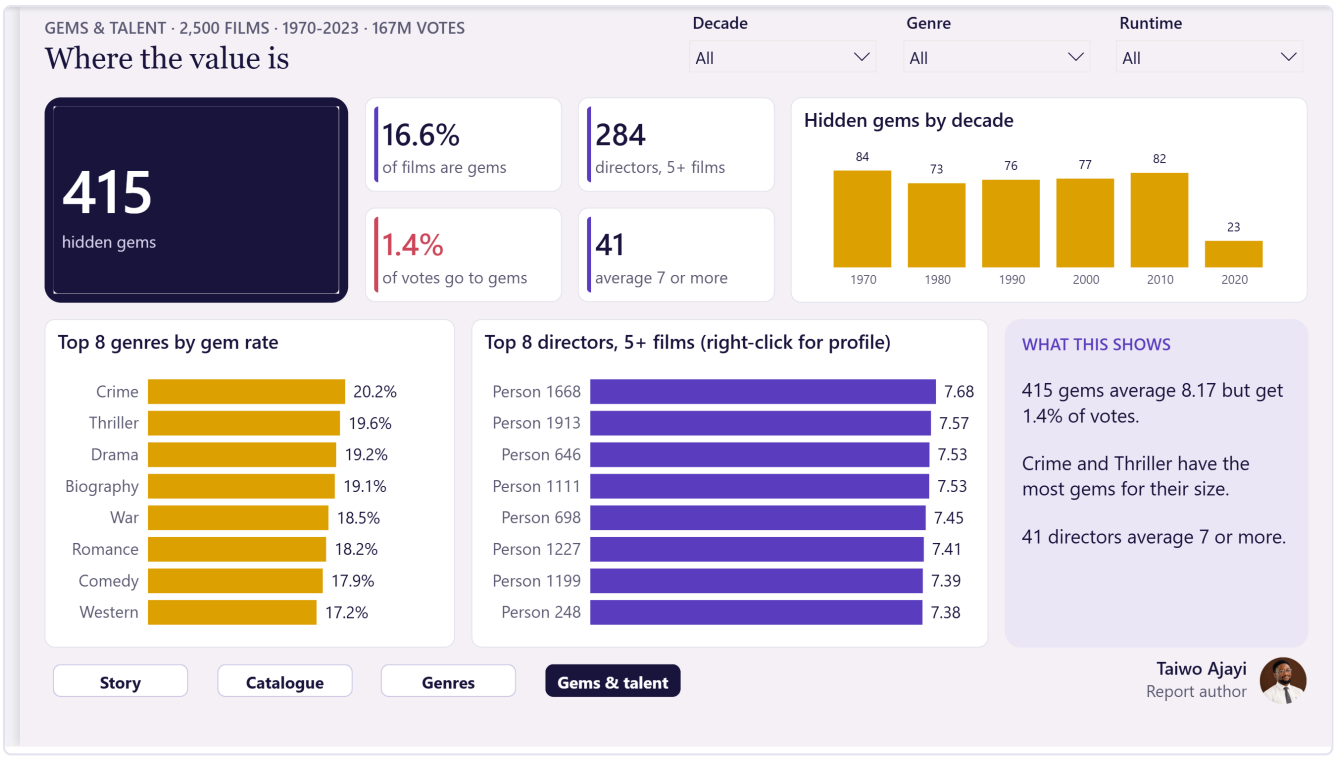

Each dashboard has synced filters, a tab bar to move between them, and a drill-through to a detail page.

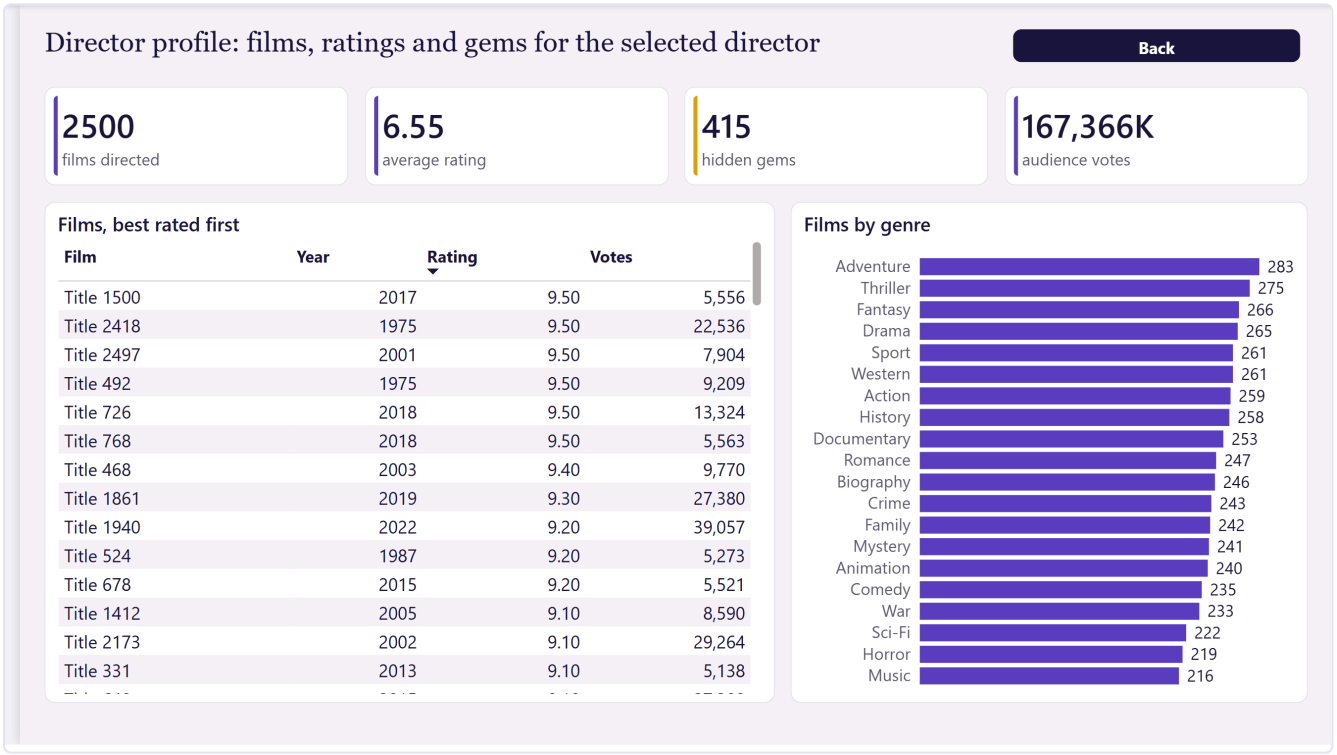

D1 Catalogue overview. Films, votes, ratings and runtime

D2 Genres and audience. Genre ratings, votes and concentration

D3 Hidden gems and talent. Gems by genre and top directors

Director profile. Hidden drill-through page: right-click a bar on a dashboard to open it

QUALITY AND SKILLS

What I fixed, and what this shows

Errors I found and corrected in the original analysis

- "Rising genre concentration" was a calculation error; votes are spread almost evenly.
- The "Under 60" runtime group was missing data; relabelled "Unknown".
- Hidden-gem counts showed decimals (415.00).

Skills demonstrated

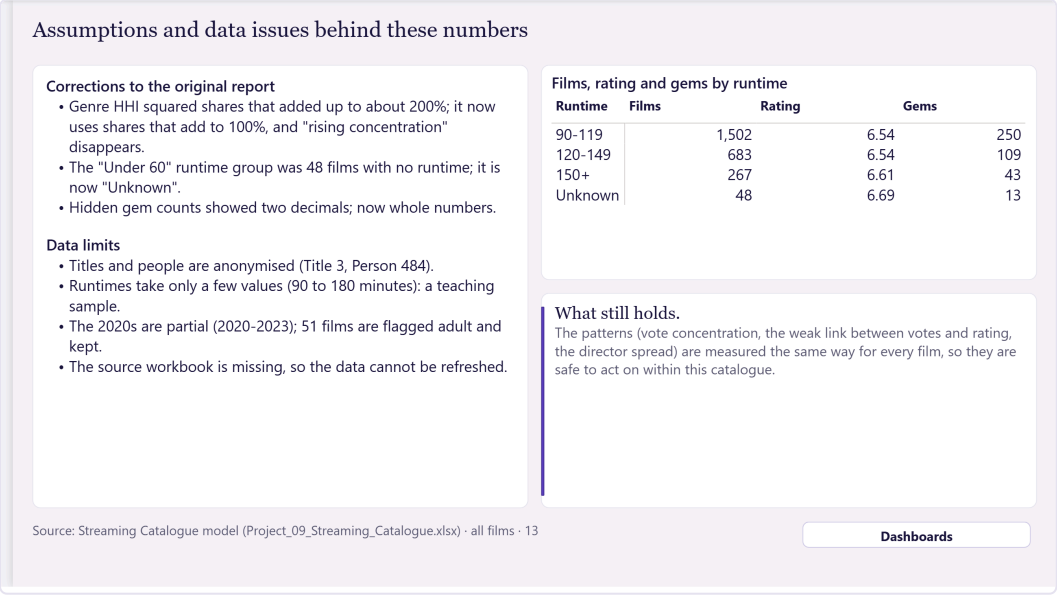

- Data profiling and validation before reporting
- Star-schema modelling and DAX measure design
- Correcting flawed measures and documenting why
- Insight-led storytelling: one finding per page
- Executive dashboard design with drill-through
- Clear documentation for readers and maintainers

Tools

- Power BI Desktop (PBIP project format)
- DAX and Power Query (M)
- TMDL and PBIR source files
- Excel source data

Deliverables

- 17-page Power BI report
- Full report PDF (every page)
- Detailed report guide

The data notes page: every correction and data limit is stated in the report itself.
